

## **An Oversimplified Cartoon Model of Life**

In the beginning was an egg. The egg had part of the code that would come to be a human. In the beginning was also a sperm. The sperm had the other parts of the code.

The sperm and egg combine and something truly wonderful begins. The divine spark has begun a new life that is part of and one with all other life and part of everything.

The now fertilized egg (baby) has an electrical polarity and embeds in the wall of the mother.

The electrical current flows back and forth throughout the baby and it begins to develop.

What used to be an egg begins dividing as electrical current flows and begins creating a new human from the complete blueprint.

As the baby is formed, each cell has electrical resistance. This resistance is different within each cell.

Resistance to the divine spark of life across all the different cells controls which cells receive the building blocks of life (now supplied by the mother).

Resistance to electrical current causes heat.

Heat causes more resistance.

More building blocks of life are supplied to an area to help it recover and grow.

Current keeps flowing and keeps being resisted by the continually differentiating cells and the baby keeps growing and developing.

The baby develops a heart.

The baby develops a spinal cord.

The baby develops a brain and a stomach.

The baby develops eyes.

Eventually all else develops.

All develops according to electrical resistance to the divine spark. The divine spark gives order to matter. Everything has a different resistance as it develops.

Eventually, the baby can think.

### **An Oversimplified Cartoon Model of Life**

Eventually, the baby can move.

When the baby thinks, there is resistance to the divine spark in the brain.

Just like with the rest of development and life, resistance to the divine spark alters the form of matter.

Thinking in different ways begins to develop connections and further divide resistance in the brain.

The more a baby thinks in different ways, the stronger those pathways get.

As those pathways develop, they can handle more and more current than they were able to before.

This process proceeds and the baby and think about many things and begins to have different experiences.

At a certain point, the baby practices moving. Limbs get stronger and develop from the divine spark being directed through the brain out to the muscles.

All else develops and the baby is formed.

The baby is born and begins to eat and grow on its own.

It is now an independent life that is still one with life.

The baby becomes a child and continues to take in food that is made of life that came from matter.

The divine spark continues to flow through our little human.

The human thinks and their limbs move.

The body acts on its own according to the way the systems were designed and keeps everything running.

All grows and receive the building blocks of life that are available according to each part's respective needs according to each part's resistance to the divine spark. The whole body is a system.

Consciousness has met matter and life proceeds.

### **An Oversimplified Cartoon Model of Life**

The less resistance to the divine spark, the more easily the divine spark can flow and the more the pathway is strengthened over time.

Hello God/Source/Creator.

God/Source/Creator has joined consciousness and matter and there is life.

### Quantum Appendix

Rather than sperm and egg, this process is also consciousness and physical meeting and experience proceeding.

Infinitely alive consciousness meets completely dead matter and there is life and all are present and all are one.  $\text{Infinity} = 0 = 1$

Rather than consciousness, this can be thought of as yes/no, maybe and then something happening.

This is quantum.

Beyond the simple quantum, there is another level. yes/no, maybe, something happening and something pre-existing.

Yes/No, maybe, that which takes the action, father time (God/Source/Creator).
